TweakTown

Our Verdict

With its hip-hop-inspired look, the GeForce RTX 5070 Ti is one of the more stylish RTX cards on the market, but it's also backed by solid performance and enough OC potential to make gaming performance even higher.

Pros

- ✓ Rock-solid 1440p gaming performance
- ✓ DLSS 4 and 4.5 are both game-changers
- ✓ Ready for path tracing
- ✓ Stylish, hip-hop-inspired design
- ✓ Excellent cooling and thermal performance

Cons

- ✗ Current GPU pricing and availability
- ✗ Serious competition from AMD's RDNA 4 line-up
- ✗ Not quite the generation leap forward when compared to the RTX 4070 SUPER

Introduction

It's been over a year since the arrival of the GeForce RTX 50 Series. Since then, it's become clear that the most popular model among PC gamers, whether upgrading their existing rig or putting together something new, has been the mid-range GeForce RTX 5070. It's not only the most popular card in the GeForce RTX 50 Series but, according to Steam's most recent data, one of the most popular discrete gaming GPUs, period. Although the current memory crisis, shortages, and price increases affecting the wider consumer technology market have certainly put a damper on the value proposition of building any new PC for gaming, it's still worth a look. Let's see why the GeForce RTX 5070 is the sweet spot for many gamers.

It's a mid-range sweet-spot GPU that shines when gaming at the popular 1440p resolution, with performance and image fidelity enhanced with DLSS 4 and the new DLSS 4.5 technology. It's also got 12GB of fast GDDR7 memory, so for now it's more than capable of running the latest titles with high or very high graphics settings, with or without ray tracing, and delivering a consistent 60+ or even 100+ experience when you factor in DLSS. Although it's not quite as much of a generational leap over the GeForce RTX 4070 SUPER refresh that arrived at the beginning of 2024, when you compare the overclocked COLORFUL iGame GeForce RTX 5070 Ultra OC's performance to the baseline GeForce RTX 4070, you're looking at a decent 30% performance increase, on average, when gaming in 1440p.

We got our first look at COLORFUL's graffiti and street art-inspired iGame Ultra design last year, with the company releasing white variants for the GeForce RTX 50 Series lineup. This year, the design has been updated, with

the new Ultra models arriving in black and purple, a darker and more striking look better suited to builds that aren't going for that all-white look. Aesthetics isn't the most important thing when it comes to a GPU, but it's an important part of the design, especially when most modern cases have either a single tempered glass side panel or panoramic views.

The good news is that, in addition to the COLORFUL iGame GeForce RTX 5070 models, it also has the top of the line 1440p gaming beast that's also capable of cinematic games with ray tracing.

RTX Blackwell - NVIDIA's Gaming Architecture for the AI Era

Below is a summary of NVIDIA's GeForce RTX 50 Series and RTX Blackwell architecture, applicable to all models.

NVIDIA describes 'Neural Rendering,' which includes all previous versions of DLSS and the brand-new DLSS 4, as the 'next era for computer graphics.' They're not alone; the Lead System Architect for the PlayStation 5 Pro console, Mark Cerny, said that ray-tracing is the future of games and that AI will play an integral role in making that happen. DOOM: The Dark Ages developer id Software shared a similar sentiment, adding that the arrival of DLSS was an 'inflection point' for PC game visuals and performance, and on par with the arrival of dedicated GPUs and programmable shaders.

With the arrival of the Blackwell generation and the GeForce RTX 50 Series, AI is now being used to accelerate programmable shaders with the brand-new RTX Neural Shaders. Yes, these are actual neural networks that use live game data, and the power of Tensor Cores to do everything from compress textures, render lifelike materials with a level of detail impossible to match using traditional rendering methods, and even use AI to partially trace rays and then infer "an infinite amount of detail" for a more accurate representation of indirect lighting.

However, with the 5th Generation Series delivering 2.5X more AI performance, RTX 50 Series GPUs can execute full-resolution ray-traced images in milliseconds. Part of the reason is the new hardware Flip Metering, which is a new engine, resulting in frame rate stuttering. With up to 15 of even more performance, up to 8X the performance when it comes to performance.

DLSS Super Resolution and Ray Reconstruction are also switching to a new 'Transformer' model, with over double the number of parameters and four times the compute requirements. This is one of the most exciting aspects of the GeForce RTX 50 Series, as it pushes DLSS into a new realm of image quality and performance. DLSS 4.5 takes this even further. The best part is that it works on all GeForce RTX GPUs; however, there will be a

performance hit compared to running it on an RTX 50 Series GPU. Already available in 250+ games, DLSS 4 and 4.5's Transformer model is another DLSS 2.0-like moment for the technology, and the results speak for themselves.

Even better, DLSS is now integrated with NVIDIA's 'Override' feature that allows users to wait for a patch or game update without losing performance. Management Processor (AMP) for AI-accelerated graphics workloads. As a result, DLSS is now alongside AI assistants like NVIDIA's AI Assistant, prevalent in the coming years. DLSS is also an assistant for streamers, who can use DLSS to expand creator features.

RTX Blackwell introduces 4:2:0 chroma subsampling and decoding. The ninth-generation NVENC encoder delivers HEVC quality. The flagship GeForce RTX 5090 supports up to three encoders and two decoders, delivering a 50% gen-over-gen speed improvement over the GeForce RTX 4090. The GeForce RTX 5080 adds a second decoder compared to the GeForce RTX 4080. RTX Blackwell is a game-changer for creators and editors, especially with its new low-voltage, cutting-edge GDDR7 memory that dramatically improves bandwidth and speed.

Specs and Test System

Specifications

Here's a look at the specs for the GeForce RTX 5070 compared with the previous-generation GeForce RTX 4070, GeForce RTX 4070 SUPER, and GeForce RTX 5070 Ti.

GPU Specs	GeForce RTX 5070 Ti	GeForce RTX 5070	GeForce RTX 4070 SUPER
Architecture	Blackwell	Blackwell	Ada Lovelace
Process	TSMC 4N	TSMC 4N	TSMC 5N
CUDA Cores	8960	6144	5888
Tensor Cores (AI)	280 (5th Gen)	192 (5th Gen)	224 (4th Gen)
AI TOPS	1406	988	782
Ray Tracing Cores	70 (4th Gen)	48 (4th Gen)	56 (3rd Gen)
GPU Boost Clock	2452 MHz	2512 MHz	2310 MHz
Memory	16GB GDDR7	12GB GDDR7	12GB GDDR6X
Memory Interface	256-bit	192-bit	192-bit
Bandwidth	896 GB/s	672 GB/s	600 GB/s
TGP	175W	130W	175W

When looking purely at the specs, the RTX 5070 is a bit of an oddity. It's built on a similar, 4nm process as the GeForce RTX 4070, but it has more CUDA Cores. Not only that, but when compared to the RTX 4070 SUPER refresh, the GeForce RTX 5070 has more CUDA, Tensor, and RT Cores. This is not an incremental update or refresh, but a leap forward. However, the RTX 5070 Ultra OC delivers 14.3% more performance than the RTX 5070 Ti, 30.4% faster than the GeForce RTX 4070 SUPER.

This makes the RTX 5070 a showcase of sorts for the architectural improvements and enhancements that RTX Blackwell brings to modern PC gaming. And with performance eclipsing the GeForce RTX 4070 SUPER, it can do more with less while leveraging its advanced AI hardware for DLSS 4.5 Super Resolution and Dynamic Frame Generation to unlock a new level of performance, smoothness, and image fidelity. As an OC model, COLORFUL's design here includes a physical 'Turbo' button that boosts the Boost Clock speed to 2557 MHz, a modest but still notable increase over the 2512 MHz reference design, with the option to further increase clock speeds via the company's revamped iGame Center app.

One area where the GeForce RTX 5070 really shines is in its efficiency, offering over 30% more performance per watt than the previous generation. And with the 12GB model offering 100% more VRAM, it's a game-changer for those who need it. The fast-paced world of PC gaming is always evolving, and the RTX 5070 is a testament to the power of AI hardware inside the RTX 50 series. It's not just about raw power and architecture supporting FSR 4.5, but also about the ability to run locally that would otherwise not be available on the RTX 4070. And for creators, you've got the latest NVENC hardware for video encoding and decoding, and all of the latest software and features that leverage RTX Blackwell to enhance app performance. Throw in DisplayPort 2.1, HDMI 2.1, and PCIe Gen5, and the GeForce RTX 5070 is still as cutting-edge as it was the day it was released.

Physical Design and Aesthetics

COLORFUL notes that the design nods to street art and graffiti, lending the overall look a layer of vibrant energy. While the black variant, we think this new dark theme is a bold choice. Between the two, as the black blends elegantly with the metallic accents, the RGB light strip that spells out "COLORFUL" in a retro, 1980s, and the holographic effect is subjective, but we think it's one of the best. The RTX 5070 cards out there won't be to everyone's taste.

Our chosen benchmarks cover a wide range of technologies. For the COLORFUL iGame GeForce Performance Meet 5 tests are run at 1080p, 1440p, and 4K, and include results for performance-boosting Super Resolution technologies like NVIDIA DLSS 4 - including Frame Generation and Multi Frame Generation. In many ways, DLSS numbers are more important than native rendering - a title with ray tracing isn't meant to be played without Super Resolution. Also, DLSS technologies like Ray Reconstruction dramatically improve visual fidelity and detail compared to native rendering. However, our benchmark results are still sorted using 'raw performance' or native rendering.

Here's the breakdown of games, settings, and what's being tested.

Games and Settings Benchmarked

competitive titles, where FPS performance is more important than visual fidelity or cinematic lighting effects. Although the COLORFUL iGame GeForce RTX 5070 Ultra OC is better suited for 1440p gaming, it is still an absolute beast at this resolution, with an average of 163 FPS across all 10 titles in our benchmark, which is 27.3% faster than the GeForce RTX 4070 and 41.8% faster than the GeForce RTX 5060. At this resolution, the performance also eclipses that of the GeForce RTX 4070 Ti and comes in slightly faster than the GeForce RTX 5070 Founders Edition.

However, at this resolution, you are looking at diminishing returns and bottlenecks, which is why there's only a 10% difference between the COLORFUL iGame GeForce RTX 5070 Ultra OC and the GeForce RTX 5070 Ti. A figure that climbs up to 20% when you bump up the resolution to 4K. Interestingly, the COLORFUL iGame GeForce RTX 5070 Ultra OC delivers, on average, performance comparable to the Radeon RX 9070 when gaming at 1080p. However, performance is notably faster in titles like Call of Duty: Black Ops 7. And by the way, the GeForce RTX 5070 takes a cool 200W, delivering over 400 FPS at 1440p.

while maintaining fantastic performance, further enhanced by DLSS 4 Super Resolution. With only a 27% drop-off in performance when increasing the resolution to 1440p, this is still enough for the COLORFUL iGame GeForce RTX 5070 Ultra OC to deliver an average of 120 FPS across the ten games in our benchmark suite. And as DLSS 4 and 4.5's 'Quality' Super Resolution preset preserves or even improves image quality, that figure jumps up to 140 FPS.

Compared to the previous generation's GeForce RTX 4070, this is a flat 30% improvement. This 30% improvement also applies to the GeForce RTX 5060 Ti 16GB graphics card, a model that is best described as the best bang-for-your-buck 1440p GPU in the GeForce RTX 50 Series lineup. Make no mistake about it: at this resolution, the GeForce RTX 5070 delivers enthusiast-class performance and immersion. The hardware-intensive Ultra ray tracing mode in Cyberpunk 2077 runs at a solid 80 FPS with DLSS, with DOOM: The Dark Ages pushing behind the baseline Radeon R adoption of DLSS 4 is a major gaming performance. Here, C Founder Edition reference des 4070 Ti.

also puts pressure on VRAM, requiring more capacity to render titles in 4K, especially for ray tracing and games with Very High or Ultra-like settings. Increasing the resolution from 1440p to 4K results in a 43% performance drop when gaming in 4K on the COLORFUL iGame GeForce RTX 5070 Ultra OC. Now, this isn't to say that the GeForce RTX 5070 isn't capable at this resolution, but we see the average drop to a still-very-respectable 69 FPS.

Ultimately, gaming at 4K on the GeForce RTX 5070 is all about leveraging DLSS and even using the 'Performance' preset to hit a stable 60+ FPS in demanding titles like Assassin's Creed Shadows, Cyberpunk 2077, and DOOM: The Dark Ages. That said, it's still more than capable of pushing 110 FPS without DLSS with the 'Extreme' graphics preset in Forza Horizon 5. At this resolution, COLORFUL's overclocked model maintains its 30% lead over the previous-gen GeForce RTX 4070 and GeForce RTX 5060 Ti 16GB. However, at this resolution, the Radeon RX 9070 does increase its performance advantage.

Benchmarks - 3DMark

3DMark offers a suite of synthetic benchmarks built to test GPUs in various scenarios. 3DMark Steel Nomad is a cutting-edge DirectX 12 benchmark that uses modern rendering techniques to push GPUs to their limits. The 'Light' version tests at 1440p, while the main Steel Nomad benchmark tests pure native 4K rendering. Port Royal is a benchmark focused exclusively on real-time ray tracing for lighting effects, including reflections, shadows, and more.

 COLORFUL iGame GeForce RTX 5070 Ultra OC Review - When Style and Performance Meet 19

 COLORFUL iGame GeForce RTX 5070 Ultra OC Review - When Style and Performance Meet 20

3DMark's Steel Nomad was built to replicate the visual effects and rendering technologies used in the latest cinematic single-player games, such as

Resident Evil: Requiem and Crimson Desert. When it comes to the 1440p and 4K synthetic benchmark scores for the GeForce RTX 5070, the results paint a slightly inflated picture of the sort of gains you can expect when comparing performance to the GeForce RTX 4070 and the GeForce RTX 5060 Ti 16GB GPUs. Here, COLORFUL's OC model delivers scores that are, on average, 45% higher than those of these cards, a result that doesn't quite line up with the 30% we saw when gaming. However, the scores do line up when comparing performance to the GeForce RTX 5070 Ti and the Radeon RX 9070, with the COLORFUL iGame GeForce RTX 5070 Ultra OC scores coming in 20% and 7.5% lower, respectively.

The Port Royal results are a little more interesting, as they showcase just how much progress AMD has made with its new RDNA 4-powered Radeon RX 9000 Series. Here, the GeForce RTX 5070's score is actually lower than the Radeon RX 9070's, even though it's still around 40% higher than the GeForce RTX 4070 and GeForce RTX 5060 Ti 16GB. That said, even though the Port Royal benchmark is a hardware-intensive ray-tracing test, the results do not apply to modern ray-tracing titles with path-tracing support. NVIDIA's GeForce RTX 50 Series still has the edge, with the GeForce RTX 5070 outperforming the flagship Radeon RX 9070 XT, while offering a more comprehensive suite of AI-powered DLSS technologies to improve performance, fidelity, and smoothness.

Although Frame Generation is a hot topic within the hardcore PC gaming community, there are many scenarios and use cases where it can be a game-changer. In scenarios where Frame Generation or Motion Vector Interpolation (MVI) is used, those where it's entirely optional. DLSS Resolution delivers a baseline performance in gaming on a high-refresh-rate monitor. With Frame Generation, you get the smoothness, motion clarity, and immersive gaming experience at 120+ FPS, with the responsive controls you expect at 60+ FPS. For the GeForce RTX 5070, it's definitely something we recommend for playing games like Cyberpunk 2077 or DOOM: The Dark Ages at 1440p with ray tracing enabled.

Path Tracing Performance

Path Tracing, or Full Ray Tracing, arrived with the GeForce RTX 40 Series and DLSS 3 and is leveling up with the GeForce RTX 50 Series and DLSS 4. It's only possible thanks to AI technologies like DLSS Super Resolution, Ray Reconstruction, and RTX Neural Shader technology like RTX Mega Geometry. It's designed specifically for these technologies, and we're only including native or rasterized performance to highlight just how intensive it is

on a mid-range GPU like the GeForce RTX 5070. In fact, aside from the massive performance boost, these games also look notably worse without DLSS 4.

For fans of cinematic visuals and much more than a way to make like. It enhances the immersive consistency and believability of outdoors, bathed in neon light. support is growing, path tracing powerful GPUs like the GeForce best 'mainstream' path tracing eclipses the RDNA 4 flagship experience in 1440p with DLSS 100+ FPS with Frame Generation. In addition to Cyberpunk 2077 and DOOM: The Dark Ages, you can expect similar path tracing performance in Capcom's Resident Evil Requiem and Pragmata.

In addition to its funky design, the COLORFUL iGame GeForce RTX 5070 Ultra OC is impressively efficient and runs cool even when 'Turbo' mode is enabled. Even after adding another 100 or 150 MHz to the Boost Clock speed, GPU temperatures remained solidly in the 60-62°C range, with minimal noise. COLORFUL's OC model also idles at a remarkably low temperature while drawing very little power.

Final Thoughts

For those in the market for a GPU that excels at 1440p gaming while also being powerful enough to push things to 4K with DLSS, the GeForce RTX 5070 is certainly worth considering. Looking at the performance of the COLORFUL iGame GeForce RTX 5070 Ultra OC custom model, it's easy to see why the RTX 5070 is now one of the most popular cards on the market. And really, with so many options out there, model-wise, COLORFUL has still

managed to create a model that stands out from the pack. The hip-hop-inspired look might not be for everyone, but if it clicks, it's definitely a looker. Ultimately, it's the overclocked performance, cooling, and efficiency that make it a standout.

It's also worth reiterating what DLSS brings to the table, too, with the new DLSS 4 and 4.5 versions of Super Resolution and Frame Generation opening the door to impressive path tracing performance on the RTX 5070 while also offering a free performance boost to over 400 games with DLSS Super Resolution support. When gaming at 1440p, the RTX 5070's sweet spot, it's enough to take advantage of some of the best displays on the market. The only real hurdle or stumbling block, which is affecting the entire industry, comes down to price, and just how close to the original \$599 MSRP you can find one for.

Our Verdict

With its hip-hop-inspired look, the COLOREDU iGame GeForce RTX 5070 Ultra OC is one of the most stylish RTX 5070 cards on the market, backed by impressive cooling and the ability to push its stellar 1440p gaming performance even higher.
